Because you have options!

SiMobility Connect provides easy access to intermodal travel.
SiMobility Connect is a platform that enables the integration of mobility services from various providers into a single-source portfolio for the user. The platform provides a flexible partner management and system interfaces for transport operators and mobility service providers as well as integrated processes like real-time passenger information, options for multimodal itinerary planning, booking, ticket purchase, and payment – across a variety of transport modes.

The types of transportation covered can include public transport, as well as private transport services such as bike or car sharing and taxis to support trips end to end. Continuously updated traffic information can be used to optimize route recommendations in real-time. On the B2B platform, apps and portals can be implemented that allow the adaptation of the services offered to match existing operator offerings.

Prior to starting the journey, travelers can manage their entire itinerary via one interface. The platform then creates an itinerary that includes the required bookings, optimized based on individual travel preferences like travel time, cost, distance, and environmental compatibility. Subject changes, real-time updates can be made along the journey.

Once the journey has been completed, the traveler receives a single invoice for the entire trip, which simplifies payment and documentation.

Simply put, SiMobility Connect ensures an enhanced travel experience across various transport modes and makes it more attractive for providers to launch new, sustainable transport options – and for travelers to use them.

What makes us rely on our cars for our daily transportation needs? It’s simply flexible and feels reliable. What can offer us the same easy access to alternative transportation options, without having to worry about schedules, connections, and payments for the various means of transport? SiMobility Connect!

One face to the customer
Come with us on an inter-city journey to explore how SiMobility can be used in a real-world setting.

Tonight Clara wants to go out with her friends who will meet at a bar in town. Clara needs to go there right after work – as quickly, safely, and affordably as possible. From her office, she has already organized her trip by using the SiMobility Connect based app on her smartphone. She has entered her desired destination and selected the route that will get her there in time to meet her friends. Her best option is to get a taxi to the commuter train station. After the train, she can take a shared car to get her to the bar. Her payment details were saved from her last journey, and Clara knows that she will receive the best possible price for all three portions of today’s commute, compiled in one convenient electronic invoice. She steps out of office, climbs into her pre-booked taxi, and sets off for a girl’s night out.

Clara is accompanied virtually by SiMobility Connect from her point of origin to her desired destination. The system works seamlessly with the powerful SiMobility solutions Flow and JustGo, which provide Clara with location-based information and important travel-relevant updates between her modes of transit and hands-free ticketing once she boards the train.
SiMobility Connect goes far beyond current solutions: It provides real-time information on transport options in the traveler’s vicinity, allowing mobility providers to offer cars, bikes, taxis, parking options, electric vehicle charging, and everything else that might be needed for their trip. A simple touch of a phone screen is all that’s required of the traveler to book an intermodal journey, from door to door. SiMobility Connect is the flexible platform that enables operators to extend their business to include intermodal and mobile services. As such, it can serve as a major building-block in the creation of Mobility as a Service (MaaS).

Here’s what sets SiMobility Connect apart:

• A neutral platform open to all kinds of mobility offers and service providers – an important factor when it comes to achieving widespread acceptance

• Information and transactional services across transport modes, available for passengers along their entire journey

• A number of reference projects proves its effectiveness

• Existing license agreements with approximately 20 operators and mobility service providers

• High degree of flexibility and efficient partner management make integration easy – on technical, process, and business level

• Highly flexible and fully scalable incorporating cloud services

Experience inter-modal as you never have before
Planning Routing

Reference: VBB Germany (Berlin)

Berlin has one of the largest fleets of car sharing vehicles in Europe, as well as a huge number of taxis and shared bikes. The project scope included the sourcing, pooling, management, and delivery of critical transportation-relevant data for the upgrade of the Web portal of VBB, the regional public transport association for Berlin Brandenburg. The modes of transport to be incorporated into the SiMobility Connect roll-out were car sharing, bike sharing, parking, and taxis. The goal: to create an attractive alternative to car ownership.

This was achieved by pooling both inter- and multimodal information from public transport, bike and car sharing, parking, and taxi platforms across the city. Though this presented some challenges due to the large number of service providers and proprietary interfaces, the project was a major success.

SiMobility Connect allows travelers to easily navigate the sometimes complex field of intermodal transportation.
